

Theorem: Law of Total Variance

$$\text{Var}(X) = \mathbb{E}[\underbrace{\text{Var}(X|Y)}] + \text{Var}(\underbrace{\mathbb{E}[X|Y]})$$

Ex. $P \sim \text{Beta}(\alpha, \beta)$

$\underbrace{X|P=p} \sim \text{Bin}(n, p)$

$\text{Var}(X)?$

$$\textcircled{1} \mathbb{E}[X|P=p] = np$$

$$\text{Var}(X|P=p) = np(1-p)$$

$$\textcircled{2} \mathbb{E}[X|P] = nP$$

$$\text{Var}(X|P) = nP(1-P)$$

$$\textcircled{3} \text{Var}(X) = \mathbb{E}[\text{Var}(X|P)] + \text{Var}(\mathbb{E}[X|P])$$

$$= \mathbb{E}[nP(1-P)] + \text{Var}(nP)$$

$$= n \mathbb{E}[P(1-P)] + n^2 \text{Var}(P)$$

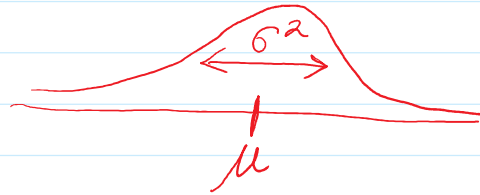

$$= n(\mathbb{E}[P] - \mathbb{E}[P^2]) + n^2 \text{Var}(P)$$

$$= \dots$$

$$= n \frac{\alpha \beta}{(\alpha + \beta)(\alpha + \beta + 1)} + \frac{n^2 \alpha \beta}{(\alpha + \beta)^2 (\alpha + \beta + 1)}$$

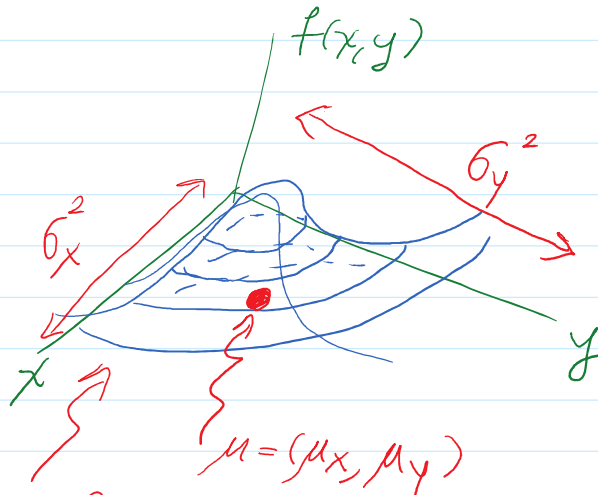

Bivariate Normal Distribution

Uni: $N(\mu, \sigma^2)$

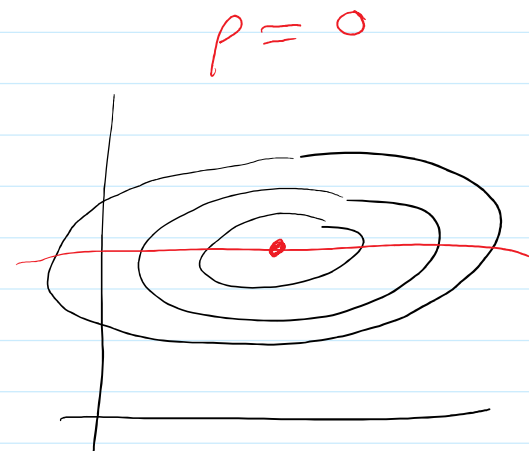

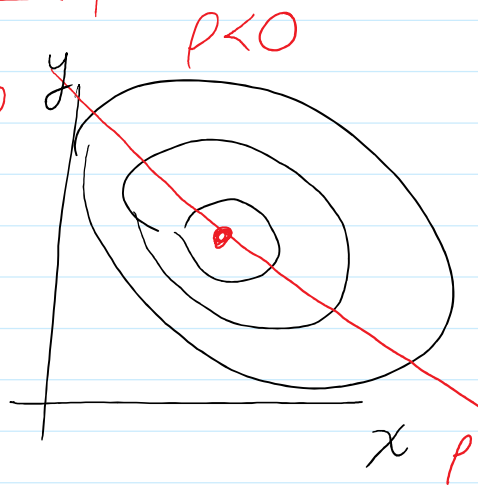

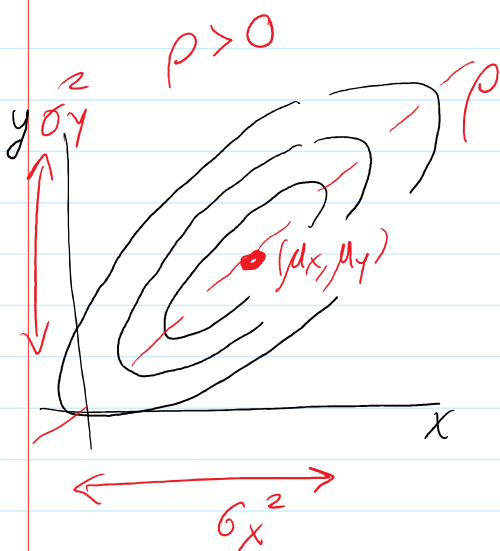

$$f(x) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left(-\frac{1}{2\sigma^2}(x-\mu)^2\right) \quad \forall x \in \mathbb{R}$$

Bivariate:

cor: ρ

PDF: $(X, Y) \sim \text{BivN}(\mu_x, \mu_y, \sigma_x^2, \sigma_y^2, \rho)$

$$f(x, y) = \frac{1}{2\pi\sigma_x\sigma_y\sqrt{1-\rho^2}} \exp\left\{-\frac{1}{2\sqrt{1-\rho^2}}\left[\left(\frac{x-\mu_x}{\sigma_x}\right)^2 + \left(\frac{y-\mu_y}{\sigma_y}\right)^2 - 2\rho\left(\frac{x-\mu_x}{\sigma_x}\right)\left(\frac{y-\mu_y}{\sigma_y}\right)\right]\right\}$$

Alt: $\mu = (\mu_x, \mu_y)$ — mean vector

— covariance matrix

$$\Sigma = \begin{bmatrix} \sigma_x^2 & \sigma_x\sigma_y\rho \\ \sigma_x\sigma_y\rho & \sigma_y^2 \end{bmatrix} = \begin{bmatrix} \text{Var}(X) & \text{Cov}(X, Y) \\ \text{Cov}(X, Y) & \text{Var}(Y) \end{bmatrix}$$

$$z = (x, y)$$

$$f(z) = \frac{1}{2\pi} \frac{1}{\sqrt{\det \Sigma}} \exp\left\{-\frac{1}{2}(z-\mu)^T \Sigma^{-1} (z-\mu)\right\}$$

Uni!

$$f(x) = \frac{1}{\sqrt{2\pi}} \frac{1}{\sqrt{\sigma^2}} \exp\left\{-\frac{1}{2}(x-\mu)(\sigma^2)^{-1}(x-\mu)\right\}$$

Facts:

① $X \sim N(\mu_x, \sigma_x^2)$

$Y \sim N(\mu_y, \sigma_y^2)$

② $\text{Cor}(X, Y) = \rho$

$$(3) aX + bY \sim N(a\mu_x + b\mu_y, a^2\sigma_x^2 + b^2\sigma_y^2 + 2ab\sigma_x\sigma_y\rho)$$

$$(4) (X, Y) \sim \text{BivN} \Leftrightarrow \forall a, b \quad aX + bY \sim N$$

$$(5) \text{ Previously: If } X \perp Y \text{ then } \text{cor}(X, Y) = 0$$

If $(X, Y) \sim \text{BivN}$ and $\rho = 0$ then $X \perp Y$.

Uni: $g: \mathbb{R} \rightarrow \mathbb{R}$ what is the dist of $g(X)$?

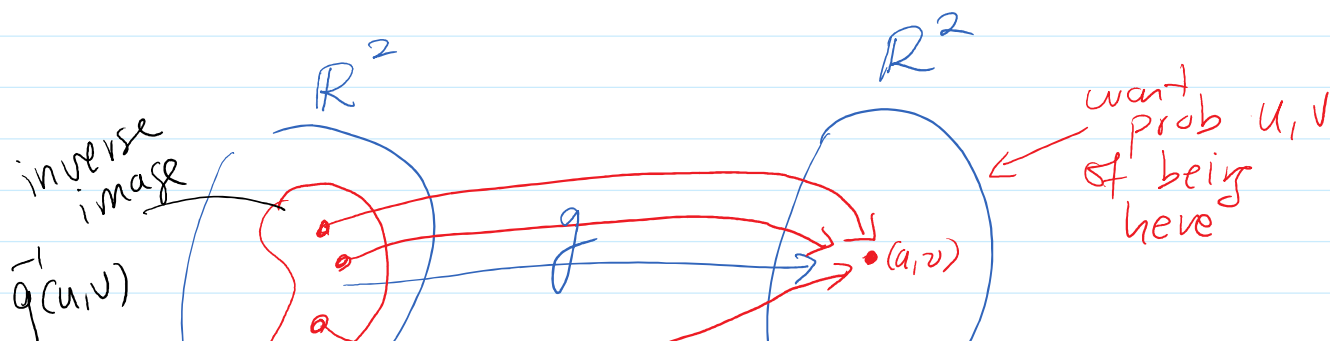

Biv: $g: \mathbb{R}^2 \rightarrow \mathbb{R}^2$ what is the dist. of $g(X, Y)$?

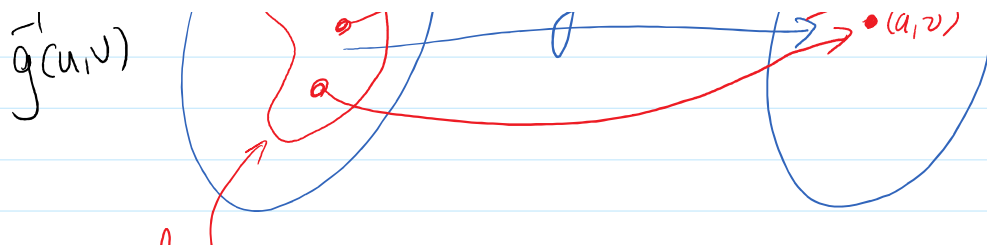

notation: $(X, Y) \xrightarrow{g} (U, V)$

$$\text{Ex. } (U, V) = (\underbrace{X^2 Y}_{g_1(X, Y)}, \underbrace{-\log Y}_{g_2(X, Y)}) = g(X, Y)$$

Discrete RVs

Assume X and Y are discrete.

instead:
calc. probs. of X, Y
being here

Want: $\underbrace{P(U=u, V=v)}_{\text{PMF of } U, V}$ from $\underbrace{P(X=\dots, Y=\dots)}_{\text{PMF of } X, Y}$

$$f_{u,v}(u,v) = P(U=u, V=v)$$

$$= P((U,V) \in \{(u,v)\})$$

$$= P(g(X,Y) \in \{(u,v)\})$$

$$= P((X,Y) \in \underbrace{g^{-1}(u,v)}_A)$$

) above picture

$$= \sum_{(x,y) \in g^{-1}(u,v)} f_{x,y}(x,y)$$

$$= \sum_{x,y: g(x,y)=(u,v)} f_{x,y}(x,y)$$

If g invertible then $g^{-1}(u,v)$ is the true inverse
and is a single point

u and v is a single point

$$= \boxed{f_{X,Y}(\bar{g}^{-1}(u,v))} = \boxed{f_{X,Y}(g_1^{-1}(u,v), g_2^{-1}(u,v))} \leftarrow$$

Ex, let $X \perp Y$ and

$$\left. \begin{array}{l} X \sim \text{Pois}(\theta) \\ Y \sim \text{Pois}(\lambda) \end{array} \right\} \text{discrete}$$

So

$$f_{X,Y}(x,y) \overset{\text{independent}}{=} f_X(x) f_Y(y) = \underbrace{\frac{\theta^x e^{-\theta}}{x!}}_{f(x)} \underbrace{\frac{\lambda^y e^{-\lambda}}{y!}}_{f(y)}$$

Let $U = X + Y$ and $V = Y$

$$(u,v) = g(x,y) = (x+y, y)$$

$$u = g_1(x,y) = x+y$$

$$\underline{v = g_2(x,y) = y}$$

$$U = V + \text{something} \geq 0$$

$$U \geq V$$

lets get inverse,

$$\text{notice } u-v = x+y-y = x$$

$$\text{so } \boxed{x = \tilde{g}_1^{-1}(u,v) = u-v}$$

$$\boxed{y = v = g_2^{-1}(u,v)}$$

$$y = v = g_2'(u, v)$$

$$f(u, v) = f_{X,Y}(g_1^{-1}(u, v), g_2^{-1}(u, v))$$

$$= f_{X,Y}(u-v, v)$$

$$= \frac{\theta^{u-v} e^{-\theta}}{(u-v)!} \frac{\lambda^v e^{-\lambda}}{v!} \quad \text{for } u \geq v$$

Could get marginal of U .

$$f_U(u) = \sum_v f(u, v) = \sum_{v=0}^u \frac{\theta^{u-v} e^{-\theta}}{(u-v)!} \frac{\lambda^v e^{-\lambda}}{v!}$$

Binomial Theorem

$$(a+b)^n = \sum_{i=0}^n \binom{n}{i} a^i b^{n-i}$$

$$= \frac{e^{-(\theta+\lambda)}}{u!} \sum_{v=0}^u \underbrace{\frac{u!}{(u-v)!v!}}_{\binom{u}{v}} \lambda^v \theta^{u-v}$$

$$= \frac{e^{-(\theta+\lambda)}}{u!} \sum_{v=0}^u \binom{u}{v} \lambda^v \theta^{u-v}$$

$$f_U(u) = \frac{e^{-(\theta+\lambda)}}{u!} (\theta+\lambda)^u$$

$$X + Y = U \sim \text{Pois}(\theta + \lambda)$$

Theorem: $X \perp Y$, $X \sim \text{Pois}(\theta)$
 $Y \sim \text{Pois}(\lambda)$

then $X + Y \sim \text{Pois}(\theta + \lambda)$
